
Project — Digital Manufacturing (Output)

Build your own end-of-subject project here once all 5 sessions are done.

Suggested scope: take your CAD project's exported STL(s) and run the full slice → print → post-process pipeline on it, documenting settings and any troubleshooting. Pick something that maps to the on-site work: 3D프린터 슬라이싱·출력·후처리.

Suggested layout as you build it:

```
project/  
├─ notes.md          <- slicer settings used, defects hit, fixes applied  
├─ slicer-files/     <- .3mf / .gcode files  
└─ photos/           <- print result, post-processing before/after
```

This folder is intentionally empty otherwise — it's yours to fill in.
