

AI Utilization Pre-Study — 10 Hour Plan

(Prompt engineering & generative AI, mapped to internship Table 1 — AI 활용 row)

Internship table field	Value
Area	AI 활용
Class hours	10h
On-site work	문서화·코드·보고서 작성 보조 (documentation, code, report-writing support)
Matching subject	프롬프트엔지니어링활용 (교과 = credit course)
Grade	1–2nd year
Content covered	생성AI 활용법 (generative AI usage), 프롬프트 설계 기초 (prompt design basics)

Everything below covers those two curriculum items plus the on-site task, in **10 hours total**, split into 5 sessions of 2 hours. This track is cross-cutting — you can work through it in parallel with the other three packs, since it’s mostly about *how you use AI tools while doing everything else* (CAD notes, print troubleshooting, Arduino debugging, reports).

Coverage map

교과 내용	Covered in
생성AI 활용법 (basic usage patterns)	Session 1
프롬프트 설계 기초 (structuring good prompts)	Session 1, 2
문서화 작성 보조 (on-site task)	Session 3
코드 작성 보조 (on-site task)	Session 3
보고서 작성 보조 (on-site task)	Session 4, 5

Folder structure

```

How to use

- Any general-purpose AI chat tool works for this (Claude, ChatGPT, etc.) — the skills here are tool-agnostic prompt design, not a specific product’s features.
- Each session’s practice re-uses real material from your other prep packs (Arduino code, CAD notes, print

troubleshooting) — so this track directly supports the others instead of being isolated theory.

3. Tick off `progress-tracker.md` as you finish each session.

What “10 hours” means here

5 sessions × 2 hours = 10 hours, matching the table’s 수업시수. Split into 1-hour blocks if that fits your schedule better.
