
Session 5 (2h) — Capstone: End-to-End Report Workflow

Goal

Produce one real internship-style status report using everything from Sessions 1–4, pulling material from your other prep packs (CAD, printing, Arduino).

Build steps (1.5h)

1. Gather raw material: your CAD parameter choices, print settings/results, and Arduino session progress — rough notes are fine, this is the input, not the output.
2. Write a **structured prompt** (Session 1) with Task + Context + Constraints, requesting:
 - A short status summary (what's done, what's in progress)
 - A table of key technical decisions and why you made them (tolerances, print settings, MCU pin choices)
 - A “risks / open questions” section
3. Use **few-shot or explicit formatting** (Session 2) to lock the report into a consistent structure you could reuse weekly during the actual internship.
4. Run the **refinement loop** (Session 4): critique the first draft, revise it, and fact-check every specific number against your actual CAD/print/code notes — not the AI's assumptions.
5. Personally verify every technical claim in the final version before treating it as done — this session doubles as practice for the on-site 보고서 작성 보조 task, where accuracy matters more than polish.

Wrap-up (0.5h)

- Save the final report as a real file (this is a natural first entry for a weekly internship log).
- Write one paragraph reflecting on which prompting technique (specific context, few-shot, role framing, refinement loop) made the biggest difference in your workflow.

Checkpoint

- ☐ Produced one full structured status report using material from other prep packs
- ☐ Used at least 3 of the 4 techniques from Sessions 1–4 (specific prompting, examples/role, format requests, refinement loop)
- ☐ Fact-checked every specific technical number in the final report
- ☐ Can explain, in your own words, when to use AI assistance vs. when to verify manually
