
Project — Embedded Control (HW)

Build your own end-of-subject project here once all 5 sessions are done.

Suggested scope: something beyond the Session 5 capstone — e.g. combine 2+ sensors, add a simple state machine, or log data over serial to your PC. Pick something that actually maps to the on-site work: 아두이노 회로 구성, 센서 연동, 시리얼 통신.

Suggested layout as you build it:

```
project/  
├─ notes.md          <- what you're building and why  
├─ src/              <- your .ino file(s)  
└─ schematic/        <- wiring diagram / photos
```

This folder is intentionally empty otherwise — it's yours to fill in.
